---

EVGA presents a combo of high-end graphics card and sophisticated water cooling-- the GeForce RTX 2080 Ti XC Hydro Copper (model no. 11G-P4-2389-KR), a GPU encased in a full-cover end-to-end cooling block.

The graphics card consists of an EVGA GeForce RTX 2080 Ti XC GPU and a Hydro Copper full-coverage water block. The cooling block features a nickel-plated solid copper base plate with a metal shell and clear acrylic top. According to the company, the thin-pin matrix construction ensures the lowest possible temperatures for the card, as it directly cools the GPU, memory and VRMs with appropriately fitted thermal pads. Flexible inlet/outlet configurations allow customers to set up the loop as they require.

In total, the card is 266.1mm long and 115.5mm tall in a double slot width design. It is not factory-overclocked, since the GPU boost frequency is set at 1545MHz, and requires two 8-pin
