

Mobile Broadband Up 157% in USA

Written by Bob Snyder
11 March 2008

Research says the devices accessing internet via U.S. cellular broadband networks more than doubled in 2007. The majority of those machines were corporate-issued machines.

According

comScore, 2,168,000 devices used broadband cellular connections to access the web in Q4 in USA.

And 59% are corporate users.

Another study by In-Stat says smartphones worldwide will increase by an average of 33% each year through 2012 (and mobile broadband growth automatically will follow that number.)
