

The Next Tobii Generation

Written by Marco Attard
21 March 2013

Tobii announces the next generation of eye trackers-- the PCEye Go and PCEye Pro, allowing users to control all PC functions using only their eyes.

The devices connect to either laptops or desktop PCs via USB and are ideal for customers with communication and rehabilitative disabilities wanting to surf the web, play games, use environmental controls and even work on spreadsheets and documents.

The PCEye Go is the smaller option, designed for laptop and smaller display use. The PCEye Pro is optimised for operation with larger monitors.

Once connected and attached to PCs (via magnetic mounting plates), the eye trackers work through Tobii Gaze Selection software and built-in on-screen keyboard (included) or the optional Tobii Communicator.

The PCEye Go is available now, while the PCEye Pro will be available later in 2013.
