Do your customers demand a device combining the advantages of a keyboard and touch-based input? Logitech has a possible answer with the TK820, a wireless keyboard with a built-in touchpad.

Similar in look to [other Logitech Windows 8 peripherals](#) , the TK820 features a slim design, "PerfectStroke" technology for even pressure across key surfaces and keys with softly rounded edges for more comfortable typing.

The large touchpad supports up to 13 Windows 8 multi-touch gestures (via downloadable SetPoint software), while wireless connections come through 2.4GHz technology.

The TK820 should be available now in European markets.
