

A Keyboard for Mobile Gamers

Written by Marco Attard
30 October 2013

Mad Catz believes customers playing on mobile devices deserve a proper keyboard--specifically the S.T.R.I.K.E.M., a Bluetooth LE number designed for use with portable devices, including Mad Catz's own [M.O.J.O. micro console](#).

The keyboard features a portable design and NFC connectivity for quicker pairing with compatible devices. Powering all is a rechargeable lithium polymer battery.

The backlit keys include micro P.U.L.S.E. scissor keys (for "crisp actuation with a tactile click response"), an Optical Finger Navigation (OFN) mouse sensor with dedicated mouse buttons and dedicated media buttons complete with volume scroll wheel.

Customers can even store multiple macro commands via on board memory.

Mad Catz gives no release date, but expect it to be available (if not A.V.A.I.L.A.B.L.E.) by end Q4 2013 in glossy black, white and red.
