By adding its patent-pending **one-way torque technology** to the **vTilt** product line, Reell eliminates nearly all resistance to upward movement, without compromising the holding force in the downward direction. Upward adjustment of the monitor feels nearly identical to downward adjustment, says the maker.

Eliminating resistance during upward movement allows the higher holding forces large monitors require, while preserving easy movement.

vTilt combines the feel, control, and long-life of “the world's best torque technology,” with the easy integration of a VESA standard mounting configuration.

Designed to attach directly to either the 75mm or 100mm mounting holes of a standard VESA compliant monitor, the vTilt is only 5 cm deep. It's compact design includes durable nylon housing completely to seal all internal components and lubricant.
