---

Logitech announces the G410 Atlas Spectrum-- a tenkeyless (TKL) gaming keyboard featuring the company's Romer-G mechanical switches, intelligent RGB lighting and Arx app control integration.

According to the company Romer-G switches provide users with "25% faster actuation than with standard mechanical keyboards" through an actuation point of 1.5mm. The keyboard also promises durability reaching up to 70 million keystrokes within a lightweight design lacking a number pad or macro keys.

An Arx Control dock provides a smartphone and tablet stand with access to the Arx Control app, a means for mobile devices to display in-game information, vital system statistics and more. Logitech Gaming software handles backlighting control.

The G410 Atlas Spectrum ships in European markets from October 2015.
