Griffin adds MagSafe to the 12-inch MacBook with the BreakSafe Power Cable-- a quick-release magnetic connector customer plug in the USB-C port to allow safe disconnection of the rest of the cable when under stress or strain.

The latest MacBook, being dependent on USB-C for just about every feature (including power) lack MagSafe, the proprietary Apple technology first introduced in 2006. As Griffin puts it, such a feature protects laptops in case of accidents such as tripping over the power cord.

First seen back at CES 2016, the BreakSafe Power Cable feature a connector just 12.8mm deep. The actual cable is 1.8m long, compatible with USB power delivery and rated up to 60W. Being designed solely for power delivery, it does not support data or video.

The BreakSafe Power Cable is available now.
