

Extending Wifi Range via MoCA

Written by Marco Attard

Actiontec proposes a solution for customers wanting to extended wifi signal range around the home-- the WCB3000, a Multimedia over Coax (MoCA)-based wireless network adapter.

The WCB3000 leverages on existing coax wiring to extend wifi signals in areas suffering from weak wireless coverage, such as a dead zone within a 2nd floor bedroom.

It mirrors wifi signals from the router-- meaning customers remain on the "same" network if they move to a different part of the house.

Device features include dual 2.5 and 5GHz radios, TR-069 remote management support and auto-configuration when used with an Actiontec router/gateway. Installation is also fairly simple, since it simply requires plugging into a coax port.
