Boosting Wifi Networks' Range

Written by Marco Attard

Netgear promises to improve your clients' wifi networks' coverage with its WN3000RP universal wifi range extender, eliminating their wireless dead spot problems.

The extender keeps things simple by using no cables-- it plugs into any electrical outlet, while LED indicators help one find the best location for optimal coverage (usually half-way between the home router and the dead spot in question).

Through Push 'N' Connect (using WPS) it should also connect easily to both computers and routers. It also carries an ethernet port, allowing it to act as a bridge for home theatre device connection.

The company says it works with any wireless b/g/n router or gateway with all security standards, including WPA-PSK, WPA2-PSK, mixed mode and WEP.
