

Netgear Boosts Wifi Router

Written by Marco Attard
14 September 2011

Netgear launches the N900 wireless dual band router, handling wifi speeds to up to 900Mbps (with both 2.4GHz and 5GHz bands delivering data at 450Mbps).

It carries x6 internal antennas with "ultra-high-power radio amplifiers" providing more wifi range-- and wireless speeds at any given distance-- according to Netgear.

Two USB ports provide further connectivity, and an improved processor should increase data saving and retrieving speeds by up to 30%.

The company also includes a number of additional features-- Genie network monitoring, Live parental controls, printer sharing, video stream optimisation, DLNA, gigabit wired ethernet, guest access, WPA and WPA2 security protocols, usage meter and shutoff timer.
