

MonsterLabo Presents Biggest Passive Cooler

Written by Alice Marshall
13 November 2019

Back at Computex 2018, MonsterLabo presented a high-performance passive-cooled PC system dubbed [The First](#). Now the company announces the standalone availability of the massive cooler inside the machine, and names it The Heart.

The Heart is possibly one of the biggest PC coolers around, measuring 200 x 185 x 265mm and weighing 3kg. As one might imagine it does not fit inside regular PC cases, being designed around the aforementioned The First, but enthusiast customers might find it useful for custom builds. According to MonsterLabo, The Heart can cool up to a 100W CPU and 120W GPU in a fanless configuration, and the addition of a slow-turning 140mm fan boosts the totals by 40W.

For the curious, The First is based on a mini-ITX motherboard, and is compatible with SFX/ATX power supplies and graphics cards up to 270mm in length. The system is fully customisable with interchangeable skins, and offers enough space for one 3.5-inch HDD and three 2.5-inch SSDs.

The Heart is available now in a choice of black or white finishes.
