

The Smallest Colour Scanner

Written by Marco Attard

PlanOn System Solutions launches the ScanStik-- a pen-sized full page colour scanner the company claims is the smallest in the world.

Describing it as "an office in the pocket," PlanOn says the ScanStik scans a whole page at once-- just like a flat-bed scanner, only without the bulk, with a "click and scan" function scanning a full page in just 4 seconds.

After scanning, users simply connect the ScanStik to PC via USB to transfer, organise and edit scans via included ABBYY Fine Reader SE and PaperPort OCR software.

It scans documents at 150, 300 and 600 DPI as either 24-bit colour or black and white JPG files, using CLC (Crystal Line Contact) technology the company says provides "superior image quality" ideal for OCR accuracy.

Storage comes through microSD (card not included) and a rechargeable Lithium polymer battery provides power.
