After over 6 months of beta testing OMG Life launches the Autographer-- the so-called "world's first intelligent wearable camera" for customers wanting to further document their lives.

The concept behind the Autographer is similar to other wearable cameras, such as [the Memoto](#).

Users wear the camera (via clip or lanyard) and it automatically snaps photos, using 5 sensors (colour, temperature, magnetometer, motion and acceleration) to determine when to best take a picture.

The device measures 37.4 x 90mm, weighs 58g and carries a 5MP sensor, 136-degree glass hybrid wide-angle lens and 8GB of internal storage allowing it to save up to 28000 images (or 2000 images per day for up to 12 days).

It is also truly hands-free, with no means of framing or timing shots. A notification link light simply lets one know when it takes a photo.

Smartphone connectivity via Bluetooth (iPhone only, but an Android app is in the works) allows GPS functionality. Charging and PC connectivity comes through micro-USB port.

The Autographer is available now in the UK and "select" European countries for all of £400.
