

G.Skill Intros Ripjaws DDR4 Memory

Written by Marco Attard
28 August 2014

Memory maker G.Skill International announces its next gen memory modules-- the Ripjaws 4 series DDR4 memory kits, all promising "best-in-class performance, compatibility and stability."

The kits are X99 quad-channel platform compatible and clocked at 2133, 2400, 2666 and 2800MHz in sizes up to 64GB. The heatspreader features a new design, while modules are 40mm high for compatibility with most CPU heatsinks.

Memory kits running at 2400MHz or greater also support XMP 2.0 for automatic tuning.

Ripjaws 4 memory kits will be available on an as yet unannounced date in either red, blue or black.
