

Corsair Presents Vengeance RGB Memory

Written by Marco Attard
23 March 2017

Corsair announces the Vengeance RGB-- a DDR4 memory line featuring native RGB lighting customers can control through Corsair Link software on compatible motherboards.

The Vengeance RGB modules do not need additional wiring in order to get the lighting to work, and are capable of 1 colour per dim at any moment. They can also shift between 4 dynamic modes, with either 1 static colour per module, breathing, colour shifting per module or a rainbow between different modules.

Corsair Link software allows control of all compatible PC components, such as RGB case fans, liquid coolers and power supplies. The DDR5 RAM modules come in 16 and 32GB sizes clocked at either 2666MHz with CL16 timings or 3000MHz with CL15 timing. XMP 2.0 support is included for easy setup.
