

Antec Presents Memory at Computex

Written by Alice Marshall
14 June 2018

Taiwanese PC component maker Antec takes to Computex 2018 to present its entry in the memory business with no less than 5 families of DDR4 DIMMs with performance profiles ranging from entry-level to enthusiast.

In all, Antec offers the 1-series for system integrators, the 3-series for entry-level DIY builds, the 5-series TUF Gaming for mainstream DIY builds and the 7-series for enthusiasts. The modules are based on DRAM chips from various suppliers according to performance and overclocking requirements, and the 5- and 7-series include RGB lighting.

The company is still to finalise the performance of the modules, but the 5-series tops at around 3000 MT/s. The 7-series promises somewhat faster performance, while the 1- and 3-series should be lower-end.

Also still unconfirmed is the release date of the memory series, but Antec says they should hit the market by Q3 2018.
