

Inno3D Intros iChill Memory

Written by Alice Marshall
15 August 2018

The next product category for graphics card maker Inno3D is memory-- namely iChill-branded memory modules available in 4, 8 and 16GB DIMMs, all featuring RGB lightbars compatible with Asus Aura Sync software.

The DIMMs are rated for speeds starting from DDR4-2400 and up to DDR4-4000, with ultra-low latencies up to 15CL. The RGB lighting comes on the heat spreaders, which the company says have a unique design able to optimise system performance to further improve the gaming experience.

“We have entered a new era of providing more system performance to the gamer and the demanding high performance addict,” Inno3D says. “Our memory products stand for a brutal gaming experience just as our graphics products and aimed to shock the gaming world with its high performance and adaptive design”.

Inno3D should start shipping the iChill memory modules by end August 2018.
