

Silicon Power Intros XPower Gaming RAM

Written by Alice Marshall
25 October 2018

Silicon Power is the next company to take on enthusiast-class DRAM with the XPOWER DDR4 memory modules-- a line featuring dual-channel 16 GB (2×8 GB) and 32 GB (2×16 GB) kits aimed at the latest platforms.

Based on custom 10-layer PCBs to ensure stability while operating at speeds beyond JEDEC standards, the XPOWER line includes DDR4-2666 CL16, DDR4-3200 CL16, DDR4-3600 CL19, and DDR4-4133 CL19 modules with power consumption reaching up to 1.4V. The addition of XMP 2.0 technology allows for simpler speed setup.

Silicon Power offers XPOWER modules in a choice of two flavours-- regular AirCool modules and Turbine modules featuring a cool blue aluminium heatsink.
