Corsair releases the Vengeance RGB Pro Light Enhancement Kits-- DRAM modules containing no actual DRAM, since the product is designed to provide more RGB lighting from vacant DIMM slots.

Available with a choice of black or white aluminium heatspreaders, the light enhancement kits are designed, as Corsair puts it, "complete your system's look" with a design and lighting identical to Vengeance RAM modules from the company. As such, each module carries 10 ultra-bright RGB LEDs, with each LED being individually addressable.

Customers can configure and synchronise the lighting via iCUE software, through a choice of either "dozens" of lighting presets or simply creating a new one. The modules should be compatible with "most Intel and AMD DDR4 motherboards."

The Vengeance RGB Pro Light Enhancement Kits are available now.
