

Samsung Smartphones Go Round

Written by Marco Attard
09 October 2013

Samsung presents the first smartphone with a curved display-- the Galaxy Round, a device armed with a gently concave 5.7-inch OLED display allowing for what the company calls "round integration experiences."

The device looks nothing like the curvy prototype Samsung showed at CES 2013 as part of the [Youn flexible OLED series announcement](#)

. Instead the Round offers a number of unique (or gimmicky, depending on how you look at it) UI features, including tilting on one side to quickly check notifications and a one hand operation mode bringing desired controls to a preferred side of the screen.

The larger display real estate also finds use in a tablet-style Multi Window multitasking mode.

Few more tech details are currently available, other than it being 7.9mm thick and weighing 154g while packing a 2800mAh battery and LTE radios.

The Galaxy Round is available now in Samsung's home Korea in a "luxury" shade of brown for around 1 million won (or \$1000). We await [your move, LG.](#)
