MSI claims its latest all-in-one (AIO) PC on show at CeBIT 2013 is ideal for the more gaming-oriented customer-- the AG2712, a desktop featuring a 27-inch multitouch display and fairly solid specifications.

While it looks similar to other AIO PCs, the AG2712 carries either Core i7 or i5 processor, Nvidia 670MX graphics and THX TruStudio Pro audio processing. Connectivity options include wifi, ethernet, USB 3.0 and HDMI.

The display handles 1920 x 1080 resolution and comes with a wide-angle matte or gloss finish.

MSI also offers a smaller variant-- the AG2212, a 22-inch model with optional discrete graphics and Core i3 CPU.

Other CeBIT 2013 PC offerings from the company include the Gaming motherboard and graphics card range, the X79A-GD45 Plus high-end desktop board and Mini-ITX boards.
