Power and cooling specialist NZXT launches the Kraken G12-- a liquid cooler to graphics card mounting kit with support for over 30 liquid cooling systems, including several from 3rd parties.

The Kraken G12 promises improvements on compatibility and ease of fitting compared to its predecessor, the G10. It obviously supports the latest Kraken X42, X52 and X62 AiO coolers, together with a number of 3rd party systems, and is compatible with 40 different GPUs, including reference and non-reference AMD Radeon and Nvidia GeForce graphics cards.

According to NZXT the Kraken G12 offers 40% better cooling over stock GPU coolers. It features a 92mm dedicated fan for both memory and VRM compatible with aftermarket VRM heatsinks, and has a redesigned bracket for easier installation.

"While aftermarket graphic cards have improved lately, most stock cooling systems still can't reach the performance level of liquid cooling," the company says. "That's why we decided to design the updated Kraken G12 to be easier to install and support the latest liquid AIOs."
