Gamer customers wanting a stylish PC chassis on a budget might be interested in the Cooler Master MasterBox Lite 5, an ATX mid-tower chassis featuring a "DarkMirror" front panel.

As a more mainstream PC case the MasterBox Lite 5 has little in terms of thrills of frills. What it does have is a PSU cover for the hiding of cables, four 120mm fans, space in the front and rear for liquid cooling radiators and up to 400mm space for the fitting of graphics cards. Storage comes in a single 2.5-inch SSD mount plus two combo 3.5-/2.5-inch mounts for two more HDDs or SSDs.

The trim is customisable in either red, black or white, and a transparent acrylic side panel allows one to show off internal components. Customers wanting to customise the chassis further can even get downloadable 3D printing schematics for the top or buttom trim.

"The MasterBox Lite 5 can easily go wherever you need your PC to be with its manageable size," the company says. "Following small apartment design, Cooler Master has put effort into structuring layouts to give multiple functions to a single area of the case. This creates room for a little monster build with full-sized graphics cards, liquid cooling, and SSDs."

The MasterBox Lite 5 hits the market on June 2017.
