---

PC hardware maker Phanteks enters PSU space at CES 2018 with Revolt-- a collaboration with Seasonic offering 3 PSUs within 2 ranges, the Revolt Pro in 850W and 1000W, and the 1200W Revolt X.

The Revolt Pro is described by the company as "the first expandable power supply." customers can connect a Revolt Pro with any other power supply to combine the total power output. In addition the secondary PSU acts as a backup power source via integrated redundancy feature.

In dual PSU configuration the 80 PLUS Gold Revolt Pro continuously balances the power load of both power supplies to maintain optimal efficiency levels. As mentioned earlier it comes in two models, 850W and 1000W.

Meanwhile the Revolt X is able to run dual systems from a single PSU. As such, it carries dual motherboard and CPU output connectors. It is 80 Plus Platinum, and offers continuous load sharing between the two systems to improve efficiency in comparison to using 2 individual PSUs. Phanteks says it is also ideal for customers wanting to save space, since it offers cleaner cable management possibilities.

The Phanteks Revolt PSUs hit the market on Q1 2018.
