PC chassis manufacturer NZXT announces the H1-- a small form factor mini-ITX case complete with pre-installed SFX-L 650w 80+ Gold PSU, 140mm AIO cooler, and PCIe riser card. Also launched is the BLD H1, a pre-build PC based around the chassis.

"Creating a small form factor case is something we have always wanted to improve upon because they are often challenging to build in and can hinder the performance of high-end hardware," the company says. "That is why we simplified the building process and focused on performance when designing the NZXT H1. We set out to make this one of the easiest builds you can undertake while leaving no compromises when gaming."

While small, the H1 vertical chassis promises to fit most full-size GPUs while being able to cool every component. Pre-routed cable and a rear-facing I/O on the bottom allow for easy cable management and clean-up, while the included pre-installed components decrease the number of items customers need to purchase separately.

In case customers do not want to build an own PC, the BLD H1 features the same chassis but includes an Intel Core i9 9900k CPU and an Nvidia GeForce RTX 2070 Super Founder's Edition GPU, making a machine capable of running most demanding games. Also found inside are an Asus ROG Strix Z3900I wifi, 16GB RAM and a 1TB SSD.

The H1 chassis and BLD H1 are available now.
