

SATA SSDs to Consume Less Power?

Written by Marco Attard
14 September 2011

SanDisk announces SATA DEVLSP-- an new SATA-IO standard proposal lowering current SATA SSD power consumptions.

Joining SanDisk are a number of industry leaders, including Intel, Samsung and Microsoft.

Some current best-in-class SSDs already have low power consumptions of around 50mW-- with SATA DEVLSP, SSDs should remain in a similar low power state "the majority of the time".

SanDisk has even lower targets for the standard-- as low as 5mW.

Such low power consumptions should be good news for future mobile devices, including tablets and the Ultrabooks.

Sandisk will be the first to implement SATA DEVSLIP in SSDs, of course.
