---

LG follows the wearable technology trend at CES 2013 with the Smart Activity Tracker-- a wristband-style device similar to the likes of the Nike+ FuelBand and the Jawbone UP.

Just like those devices, the LG Smart Activity Tracker tracks fitness habits (via accelerometer and altimeter) once paired with a smartphone carrying a companion app. Nike+ FuelBand users will also be familiar with the dotted LED display, USB clasp and soft-touch rubber coating.

However the LG take on the concept is compatible with both iOS and Android, with Bluetooth connectivity allowing the touch-sensitive LED display to provide smartphone media control and caller info.

It also connects with LG smart TVs, allowing for workouts from the home through fitness apps.

The Smart Activity Tracker is slated for a Summer 2013 release in a handful of different colours.
