

Amazon confirms the existence of a long rumoured touchscreen-equipped Echo device-- the Echo Show, a connected home hub featuring a 7-inch touchscreen together with voice recognition capability.

“Echo Show brings you everything you love about Alexa, and now she can show you things,” the online retailer turned cloud giant-slash-hardware maker says. “Watch video flash briefings and YouTube, see music lyrics, security cameras, photos, weather forecasts, to-do and shopping lists, and more. All hands-free—just ask.”

Another feature found in the Echo show is a camera, allowing for video calls, and Alexa skills are included for integration with smart home devices. This includes baby monitors from Ring and Arlo, Philips Hue smart lights, and thermostats from the likes of ecobee and WeMo.

On the audio side, the Echo Show carries the same 8 microphone array, beam-forming and noise cancellation technology from other Echo devices, while the speakers get Dolby enhancement.

The Echo Show ships in either black or white from June 2017.
